

VI. CLAIMS

What is claimed is:

1. A separator device, comprising:
 - A) a wound conduit member having an outermost wall portion and including an inlet and an outlet, and said outermost wall portion including a plurality of through openings; and
 - B) means for applying a pressure differential between said inlet and outlet so that a fluid having small particles in suspension entering said inlet is forced through said wound conduit member and out through said outlet causing said small particles to be forced out through said through openings by the action of centrifugal forces.
2. The device said forth in claim 1, further including:
 - C) housing means wherein said wound conduit member is mounted therein thereby containing said small particles.
3. The device said forth in claim 2 wherein said through openings are cooperatively disposed at an angle to facilitate the exit of said solids by defining an entrance adjacent to said outermost wall portion.
4. A separator device, comprising:

- A) a wound conduit member having an outermost wall portion and including an inlet and an outlet, and said outermost wall portion including a plurality of through openings; and
- B) means for applying a pressure differential between said inlet and outlet so that a fluid having liquids in suspension entering said inlet is forced through said wound conduit member and out through said outlet causing said liquid to be forced out through said through openings by the action of centrifugal forces.
5. The device set forth in claim 4, further including:
- C) housing means wherein said wound conduct member is mounted therein thereby containing said small particles.
6. The device set forth in claim 5 wherein said through openings are cooperatively disposed at an angle to facilitate the exit of said liquid by defining an entrance adjacent to said outermost wall portion.
